**Indian household CCTV expenditure by class and rural/urban divide**

In this blog I will be answering the question, 'How is household CCTV expenditure impacted by class and the rural/urban divide in India?'. I will be analysing 2016 Indian household expenditure survey data. My chosen variables for this analysis are MPCE (mean per capita expenditure), CCTV sales and rurality. I chose these variables as previous literature has shown large wealth disparities between rural and urban demographics in India (Anand 2023). However, 12% of the world population resides in the Indian rural market and a greater understanding of this segment is needed for businesses to effectively tap into it (Parida and Sahney 2017). Furthermore, CCTV expenditure by rurality can provide insight into how differing demographics prioritise safety and security, demonstrating how spending behaviour is influenced by geography. I will begin this blog with a presentation of two statistical graphs followed by a short discussion of the findings and limitations of the research.
