CCTV expenditure by class and rural/urban divide

Introduction

In this blog I will be answering the question 'how is household expenditure on CCTV security systems impacted by class and the rural/urban divide in India?'. I will be doing this by analysing data from the national sample survey 'Household expenditure on services and durable goods -July 2014 – June 2015' 72nd round. My chosen variables for this analysis are MPCE (mean per capita expenditure), CCTV sales and rurality. I chose these variables as previous literature has shown that there are large wealth disparities between rural and urban demographics in India (Anand 2023). However, 12% of the world population resides in the Indian rural market and a greater understanding of this segment is needed for businesses to effectively tap into it (Parida and Sahney 2017). I will begin this blog with a presentation of two statistical graphs followed by a short discussion of the findings and limitations of the research.
