Tutorial Session 1

Data sets and Data

1 Part 1

The first part of this week's work focuses on basic data manipulation and vector indexing using R, as outlined in Chapter 2 of "R for Marketing Research and Analytics" by Chapman and Feit.
To begin, you should download the R code file called "Chapter 2: The R Language [Exercises]" from the following link: https://r-marketing.r-forge.r-project.org/exercises/index.html. Then create an R script and follow the instructions to solve the exercises.
Follow the instructions carefully as you work through exercises. These exercises will help you understand key R concepts, such as vectorized operations and basic data analysis techniques.

2 Part 2

The Second Part of this tutorial focuses on some basic R functions using the data generated in Part 1 and some concepts learned during the teaching session. For this part you can work in pairs and answer the following questions:

1. Using these values, what is the mean, and what is the median, omitting the cases with missing data? {0, 0, 0, NA, 543, 654, 345, 678, 234}

   Which software did you use? Can you get R to produce the result?

2. Annie's store had 45,000 visits. See in store.visits. How far from the median is this?

3. Look at Chapter 3's code from the Chapman and Feit book, 2nd ed., using the online source above, please. What does `rep()` stand for?

4. Just after that, a 'promotion' is handled. What is a promotion? What is a 'simulation' in market research?

5. Using a blank sheet, write the formula for support out carefully. 'Support' is a technical marketing term for the amount of money spent on a transaction or item.
