How does spending on CCTV security equipment vary across marketing segments in India?

Word count - 1477

Abstract

This report analyses the variation in CCTV equipment spending among different market segments. The report uses Indian household expenditure survey data (2016) for its analysis. This was carried out through the use of a K-means cluster on key variables such as, CCTV expenditure, rurality, household size, MPCE, sex, religion and age. The cluster analysis showed that urbanisation was the main driving force behind CCTV expenditure. However increased household size was associated with limited CCTV expenditure. Whereas age, religion and sex had limited influence. Therefore, my hypothesis that large wealthy urban families being the primary demographics behind CCTV expenditure was only partially correct. These findings alongside limitations of this report lead me to call for further research into this topic using a newer data set for regional analysis providing niche and unique insights.

Introduction

This report will answer the question, "How does spending on CCTV security equipment vary across marketing segments in India?". I will answer this question by carrying out a K-means cluster analysis on 2016 Indian household expenditure survey data. My chosen variables for this analysis are CCTV expenditure, mean per capita expenditure (MPCE), household size, rurality, sex, religion and age. I have chosen these variables as I believe they will provide a broad insight into the driving factors of CCTV expenditure. For example, Anand (2023) finds that there are large wealth disparities between India's demographic groups particularly between urban and rural demographics. Yet 12% of the world's population resides in the Indian rural
